

# THE JOURNAL OF A PLANT

**2024 EDITION**

WRITTEN BY IZKAAN

## CHAPTER ONE

*Plants are an important asset to any functional ecosystem. Along with algae, plants are one of the few organisms that take in oxygen, and emit CO<sub>2</sub>. This makes plants necessary for survival, just like a brain is necessary for a human to survive.*

That is why, for the longest time, plants and humans co-existed peacefully, as both of them benefited one another. Plants gave humans oxygen and food, while humans grew more of them and maintained them. That's how it had been for thousands of years, until large empires and economies grew.

In the beginning of human history, humans were content with living in small villages with a few hundred people, farming up crops (agriculture) and kept animals to farm them. But as their technology advanced, empires formed, economies built, humans expanded their influence on the very world we live on. Mostly in a bad way for everyone.

To expand their empires, they started deforesting to scales never seen before, and used more harmful methods. While in the early days, the methods used to cut down the trees resulted in minimal pain and were in a low scale, the higher scale harmful destruction of trees led to the extinction of many types of plants. And this effect was only amplified during the Industrial Revolution. But plants are living things also, and they not going to accept defeat that easily.

## CHAPTER TWO

Plants also evolved over time, and they also came up with their own technological advancements. The largest of which happened a

few hundred years ago, which allowed plants to build things completely invisible from the human eye. This meant plants could also develop basic machines and electronic gadgets. For example, in deserts, plants built large water domes which stored water during the few times it rained. In addition, they also developed a system that converts polluted water\* to clean water, which was safe for use.

They built a large economy in their own world. Different areas of plants started their own tribes and favored their own economic systems such as capitalism, communism, etc. But after some conflicts, the most common economic system in the plant world became communism.

So, the communist plants were against the humans, both attempting to take over the world. While humans needed plants to some extent, plants had no major use for humans. While in the early days most the plants fought with other tribes, in these tough times, the plant world has come together to fight a greater evil.

## CHAPTER THREE

The communist plants discovered electricity a few decades ago and developed their own machines, strong enough to tackle on humans. They waited for many decades as humans were also very advanced, and they wanted to be prepared before they possibly started a war between the two most powerful species on the planet. But on 9<sup>th</sup> of November, 2042 in many regions, plants decided to make their intents clear and official.

By now, deforestation had increased beyond imagination. The large Brazilian forest “floresta amazônica” had decreased by 70% and

many other areas also now dead. This is why the plants took the risk against humans.

When these machines became equipped, the wood workers got a massive shock, as 99% of the workers ended up dead next to the plants. Some of them struggled to enter the area near the plants, and the ones that survived reported horrifying images. While this seemed like a new TikTok trend at first, once many countries reported this on their local news, it became international breaking news quickly.

There was another reason the communist plants waited so long to release their attack. They knew if all the humans worked together, they could easily wipe out all of the plants and other animals. Humans had weapons and powerful nuclear bombs, which the plants did not have. But right now, in 2042, is when the humans are most divided. Tension between America, China, Russia, and (South) Korea have risen to all high levels, with nuclear threats being common. This left the human species weaker than ever before, despite their technological advantages. In addition, the economy had a recent collapse in large countries, which gave the united communist plants a massive advantage.

## CHAPTER FOUR

Once the breaking news hit the international stage, action was quick to happen. The UN meeting happened the next day on the 10<sup>th</sup> of November, but as usual, it was quite useless for them. They kept on arguing about their usual politics and economic situations. And having a massive conflict between 3 global super powers did not make things easier for them. No action was taken for a few days, but threats were made by some large countries which had nuclear weapons in their arsenal.

Meanwhile the plants were preparing for stage two. They used a special material discovered hundreds of years ago which was extremely strong and invisible to humans to create a safe area, to lower the chances of complete annihilation. Despite the clear danger, many people still attempted to cut down trees with more intrusive and unethical ways, but the plants had murdered most of the humans who tried to do so, and damaged the machines, which dared to try. While all of this was happening, the humans were just yapping and wasting time.

Despite the clear threat plants now posed, some humans still attempted to cut down plants. As wood had now become a limited resource, difficult to harvest, the value of wood and timber rose considerably. So, in an attempt to make money, some people risked their own lives for the cash grab. But most of them died, and the once who survived had serious injuries such as paralysis, cancer, etc.

Attacks from humans increased in scale during the next coming days, with more machines attempting to tackle them. Some of them succeeded on the weaker plants without the proper equipment. Drones and other aerial objects were used to capture footage, and also attack by using large wind turbines to simulate extremely weak hurricanes. But as this became an existential threat to both parties involved, the situation was extremely serious.

This was why, a few days after the 9<sup>th</sup> November “massacre” by the “terrorist” communist plants (according to news sources) the United States of America issued more serious threats on the plants. To show their lack of hesitation, they dropped “Thin-They” which was a small missile on a Brazilian forest.

While America viewed it as a defense measure against plants, other countries did not. Brazil was not happy to be bombed by America, as the bomb also hit a part of a city. It became very clear to the plants that this was a good thing. The human species was already going through a conflict between major countries, and now the threat of missiles is going to weaken the humans in the war against plants.

The plants also wanted to showcase their military that they had developed over the past hundred years. The Brazilian floresta amazônica and its people who lived near the forest, shot American Terrorists in the area as an act of protest. Many humans were seen, with their own weapons, looking to take down major forests around the world.

## CHAPTER FIVE

The communist plants also issued a formal statement, declaring that the plants had a lot more power than the humans expect and demanding for a ceasefire. But the plants are not stupid. They knew how politics works. America never accepts a ceasefire, just as the Palestinian people in Gaza back in the 2024’s. America and its allies issued more threats.

The situation was now getting dire, despite the humans being overall weaker, they had the weapons. A single large bomb could destroy not only a large forest, but the equipment and facilities needed to manufacture more weapons. So, it was a race to see who would drop the largest bomb first.

The plants, being aware that the humans are stronger went defensive. But ultimately, humans are nothing without plants. No oxygen to breath, and more. That is why some countries opposed

what America was trying to do. They wanted peace between both plants and humans. They also realized some fundamental problems with bombing forests. This would damage the entire area, also making the area around it uninhabitable for all the humans who live there. In addition, it would be an extremely expensive endeavor, and it would just be a waste of American taxpayer money, but when has that not happened before.

The opposition delayed any major threats of humans even more. Humans and society were more fragmented than ever, while plants worked as one to achieve one common goal. To stop the mass destruction of plants. They also understood that some plants must be cut down, but they want humans to use less invasive and painful methods, and to do it at a lower scale, so that some rare types of plants don't go extinct. So, while the humans were spending most of their money on time in their meaningless conflicts and wars, the plants were thinking outside the box.

In their normal bodies, being stuck in the ground would not be extremely helpful. It would be more useful if they could overthrow America than murder a bunch of humans. That is the only way that they could bring real peace to this conflict.

This meant while the humans were wasting their time, plants started doing more research. And on the 26<sup>th</sup> of March 2043, a group of researches in Ohio discover an underground human lab. It was like nothing they had ever seen before.

## **CHAPTER SIX**

The lab, located in central Ohio was well hidden, but quite large and dusty in the inside. It was clear that nobody used this facility in a long

time, but hidden in the undergrounds of that facility, were traces of Uranium and other radioactive materials. And in the darkest deepest depths of the hidden underground bunker, there was a bunch of shredded pieces of paper.

The paper clearly said something. It was clearly a blueprint. There was slightly burnt other papers and books also located in there. The plants decided to invade the bunker, as they felt that it could contain extremely useful information.

The plants took the books and papers from the bunker, into their lab via robotic armed vehicles. They bought the shreds of papers and burnt books to their lab. Now they used the scientific knowledge gathered over eons of time, to resurrect the contents of the pages.

Using AI and other tools, they were quickly able to generate clean versions of the books. They talked about a hypothetical concept in which radiation would be used to mutate certain organs to make them do unique things. Some information about how they could do it was written in a different book they had, but it seemed that the final blueprint was within the shreds of paper.

They (the plants) felt that they had the answer to solve this issue. But the problem is the papers were not only shredded, but also slightly burnt. Using reverse nano quantum layer technology did not make most of it extremely clear, and it would be a nightmare to merge the shreds of paper together.

But with the recent advancements in technology, and massive investments by the communist groups, and perseverance and most importantly never giving up (as Rick once said), on the 6<sup>th</sup> of June 2043, the plants were able to re-assemble the paper and reveal the hidden blueprints.

It went in depth and detail on how they could use radiation to modify the blossoming seasons of plants and flowers, and the side effects of radiation. This got Dr. Vauce thinking, would it be possible to use radiation to make the plants more mobile, more portable. Little did they know, the answer was there the whole time.

## CHAPTER SEVEN

The next few months were spent on both defending their territory, as some small-scale invasions continued to happen. But most of the scientific researches and professors spent their time trying to develop a new type of plants. “It ain’t up to natural selection anymore fam” said Dr. Vauce, looking through old scientific papers. After finding nothing anywhere (including human research papers), they decided to give up.

That would have been the end, if not for one plant suggesting we take one more look at the abandoned underground bunker in central Ohio. And after more careful inspection they found it. They found the Krabby patty secret formula, and the details for the initial prototype, and a method that might possibly make the thing viable. Gene editing.

The new research document showed how radiation could be used to modify the genes, and it went in great detail. It showed what radiation would do what damage, the doses of radiation to be used, and what hypothetical equipment could be used to do this.

Now, as the plants had all the information, they could possibly need about this topic, the top-level communist scientists went to work. They spent loads of resources trying to replicate the machinery and the side effects. But the truth is things like this takes a lot of time, so

just like the Coronavirus vaccine, it might take a few months or a few years.

## CHAPTER EIGHT

While the scientific division were working hard, testing prototypes to allow plants to move freely like humans (to some extent), the military division still had a lot of work to do, in order to defend their motherland, they had to use stronger materials to block machines from entering. The biggest problem was not humans, as the little piles of cells could easily be destroyed or paralyzed by using a large capacity laser. But the machines, made out of Titanium alloy were a lot stronger.

But somehow, humans still were unable to do much about the plants. They were, as before, too busy in their own meaningless little conflicts. China, unimpressed with all the sanctions and claims made by America, decided to overthrow the American dollar. This led to economic instability, and gave the plants a lot more time than previously expected. The military division used this time to test out an emergency case, larger bomb with small doses of uranium. It was not a nuclear bomb, but a bomb that contained a nuclear warhead that meant deadly radiation would contaminate the nearby areas for years to come.

However, due to humans sheer incompetency, it seemed like everything went back to normal. The world was stuck in its own conflicts and mostly forgot about the “terrorist attacks” on 9<sup>th</sup> Nov 2042. That meant humans continued to chop down the trees in less developed areas, which lacked the proper machinery and equipment required. Thus, a greater focus was set on providing most of the forests good defense to get rid of deforestation, and issuing public

warnings. Plants knew that unless they attacked more, or overthrew America, this would be insufficient. Human technology evolves significantly faster than in the plant world. It would be too expensive and resource intensive. They needed to end it fast, to ensure the weaker but united communist plants could win.

## CHAPTER NINE

After around 3 years of research, on April 11<sup>th</sup> 2047 the plants had done it. After testing many prototypes, they had reached their goal of creating mobile plants. They used the guidelines and the information humans gave, with their own scientific knowledge to create a machine that would release specific types and levels of radiation on a molecular level, allowing them to change the genes of plants.

This meant on the following day, the first mobile plant was born. Its roots had to be sunk in the soil for 6 hours minimum for nutrition, but other than that, it was capable of moving. Not extremely fast, but many times faster than disabled people. It used a specific leaf shape to capture most of the water, and roots still to capture nutrients and minerals. However, its trunk was thicker to accommodate a storage facility that required refreshing overnight.

These changes could also be made to already existing plants, via a dangerous surgery, which involved uprooting the plants from the soil, laying them on a surface while injecting Minerals, nutrients, and radiation into their bloodstreams. It is a painful transition surgery, but it results in plants that have this extra ordinary ability. Sadly though, it is extremely expensive and only a few models could be created in the most luxurious communist regimes of the plant world.

The poor communist regimes located in Africa could not afford such advanced machinery.

In addition, most of these were assembled in America, where it would be used to overthrow the capitalistic country. But they could not understate how strong America had gotten within the last few decades. So it would require a lot more planning before such an attack could be done onto one of the most dominant countries on earth.

The leader of America, Donald Barack Biden has been pushing for large scale actions against plants. Using their media outputs, they have spread countless propaganda, calling plants “terrorists” attacking innocent workers, who are only doing their job. Thus, the plants knew that they needed to execute their plan to the highest degree in order to overthrow the American government, and declare the plants independent from the terrors caused by humans.

## CHAPTER TEN

It first began with marketing. While some humans supported stopping of deforestation, most of them did not like the idea of plants being able to murder humans with such ease. The plants had recently developed access to a gaming computer, and googles servers. Using the extremely fast PC with one of the best displays available, they started releasing their own propaganda. They bought ad spaces and spread awareness, showing how humans and plants used to live together, until the humans attacked.

This actually worked surprisingly well, and many humans preferred to give plants their rights. But still the higher political figures were not convinced. This was why the plants declared war on America on

the 6<sup>th</sup> of October 2053. They used drones to attack the “black house” in Washington DC, to weaken the wall to make invasion easier. America quickly noticed the destruction, and released dozens of bombs on forests all around America, from Alabama to Ohio, despite not knowing which forest was responsible. They ended up attacking mostly innocent, underfunded forests. Many of these plants ended up dying a terrible death. But some of them were inside the appropriate bunkers, mostly safe from the human attacks. The plant forest group near Washington began their journey, on the newly constructed rail path towards the black house. This was when the large-scale plant manufactured drones were released, causing considerable damage to areas near the black house. America kept on releasing more bombs, and finally figured out where the drones were coming from. That was why, against all odds, America released its second largest, non-nuclear bomb on a large forest just outside of Washington DC. This bomb destroyed a large part of the forest, and many nearby towns, houses, schools and buildings.

This caused immense public backlash and chaos inside the black house, which was when a group of terrorists who worked closely with the plant group helped steal the declaration of independence, and destroy other copies. The lead group of plants from another forest near the capital just arrived, with weaponry in hand. By now, a lot of security forces were alert, and Donald Barack Biden was being evacuated to a secure area, to ensure that the president lives, as they (the humans) understood the true threat. But the plants were not foolish. They surrounded the area, and began attacking. They killed many brave American military personal, and after intense fighting, one brave plant changed the world forever, for he, killed Donald Barack Biden, the president of America in 2053.

Following the president’s death, the plants were able to capture and take control of the black house. With the headquarters acquired, attacks on other government building continued. Even though the black house, the headquarters were under control, the plants did not have full control over the government.

After another few days of heavy fighting, the plant army finally captured all government building and reigned control. In this war, many brave plants sacrificed their life, and many humans also died. To threaten the humans, they launched a massive bomb on an empty desert in Nevada, as they did not want to harm anyone just yet.

The bomb caused a lot more damage than expected, and the scared people were forced to accept their new leader, Xin Bin King, the communist leader of the plants. He offered a statement explaining their intentions, and began their reign as the owners of one of the most powerful countries on earth.

## **CHAPTER ELEVEN**

Now, as the communist regime of the plants were in control, they decided to convert America to their communist beliefs. Using their bombs for intimidation, they were able to convince Canda and Mexico to join what would now be a mega country. It was called the Союз заводов (Plant Union). The communist plants wanted to recreate the next era of Soviet Union, but in a different continent. But some aspects were similar such as the languages. Союз заводов recognized English and Russian as the main two languages which would be in use in the coming years.

They changed the flags, the national anthem, and made a new declaration of independence from the humans. This new mega

country merged economies under the communist regime. Humans now knew the true power of plants, and most of them made laws that reverted things to how they were, thousands of years ago.

The plant ran Союз заводов (Plant Union), and it continued to thrive under the new regime, despite the majority of the country's population being human. The humans also recently began to accept their leader whole heartedly. Under the new ownership, the mega-country did better than ever before. They made more money than ever, and for the first time ever, America started to offer affordable healthcare and education. Safe to say, the humans agreed with most of the decisions made by their leader, Xin Bin King. For their great communist leader was out, to make what was once America, Canada, and Mexico great again. In addition, the plants were able to complete what they set out to do, to create the balance between nature, and humans.

(the end)

## STORY JAM V2

A story writing event featuring Izkaan and Rayaana. 3 weeks from February 1<sup>st</sup> to February 21<sup>st</sup> were given, to write a book based on the theme(s). The event was hosted by Izkaan, judged by Hassan. The rules for the completion were

- Make a story under 7 pages A4 size (narrow margin)
- Nothing inappropriate
- No AI language models or spell-checking websites
- Only Google docs or Microsoft word autocorrect may be used
- No vulgar topics and other\*
- There will be two themes and you can select any of them. The judge Hasaan will decide the theme. You can interpret the theme any way you want
- Themes: **plant, war** and space exploration

The journal of a plant 202r edition is written by Izkaan. It is designed by Izkaan. And most of the plot was by Izkaan. Big thanks to Rayaana Bin for helping with the plot, quote
